FL-01: AI Workflow Audit and Tool Setup

Intern Name: Ilyan Khan | Submission Date: July 15, 2026

1. Workflow Audit

Below is an audit of recurring tasks from my university studies and software development projects, classified by how AI should be integrated into each workflow to maximize efficiency and learning.

Task	Category	Rationale
1. Attending live CSE lectures	Just me	Requires my physical presence, active listening, and in-the-moment participation.
2. Defining core logic for new automations (e.g., Slack)	Just me	Requires my unique understanding of what specific problem I am trying to solve.
3. Structuring my daily development schedule	Just me	Depends entirely on my personal energy levels and daily university workload.
4. Cleaning up and organizing raw class notes	Delegate to AI with review	AI can format my rough notes into study guides, but I must verify technical accuracy.
5. Summarizing academic papers/PDFs for university	Delegate to AI with review	Speeds up my reading process, but I need to review it to ensure I understand the core concepts.
6. Writing boilerplate code for new websites/apps	Delegate to AI with review	AI generates the foundational code fast, leaving me to just review and tweak the architecture.
7. Researching documentation for Antigravity agent	Collaborate with AI	AI acts as a great interactive tutor to help me understand complex new frameworks faster.
8. Brainstorming new AI tool architectures	Collaborate with AI	Working back-and-forth with an LLM helps me expand on my initial technical ideas.
9. Debugging scripts (e.g., email reader errors)	Collaborate with AI	We can troubleshoot together by pasting error logs and iterating on the solution.
10. Drafting specific daily queries for Gemini	Collaborate with AI	I provide the initial context and intent, and we refine the prompt together to get the best output.
11. Fetching and reading new emails in Slack	Fully automate	Once the automation script is built, it runs entirely on its own via triggers without my input.
12. Categorizing saved Instagram Reels for inspiration	Fully automate	Can be handled by a background webhook (like Zapier) sending saved links straight to a Notion database.

2. Target Tasks

The following three tasks have been selected for further refinement in upcoming assignments (FL-02 through FL-04).

Target Task	Definition of "Done Well"
Researching documentation for Antigravity agent	I'll count this as a success if I can spin up a quick technical cheat sheet (including the code snippet, pros, and cons) for a new agent feature in under 60 minutes without getting stuck in infinite loops of reading.
Creating automations (e.g., Slack email reader)	Success for me means getting the script running reliably for a full week without it crashing or needing manual fixes, successfully sorting my priority emails exactly how I defined them.
Summarizing academic papers/PDFs for university	I'll know I'm doing this well when I can walk away from every paper with three clear bullet points that capture the core methodology, and I can actually explain those points to a classmate from memory.

3. Visual Evidence

(Below is the visual evidence verifying my tool workspace configurations and course completion.)

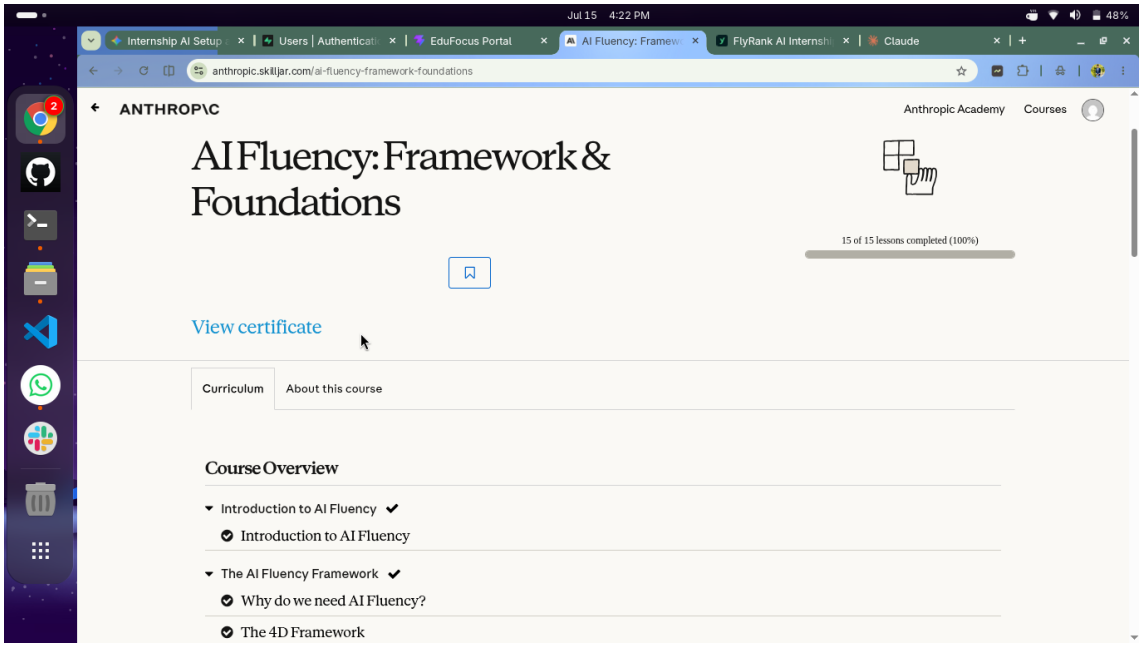

Claude Project Configuration

Screenshot showing my custom instructions and setup for my dedicated Claude Project.

Anthropic Academy Completion

Certificate/verification of enrollment and completion of the first module in AI Fluency.
